The Madness of Fear Feb 10 2021 What are the real disease entities in psychiatry? This is a question that has bedeviled the study of the mind for more than a century yet it is low on the research agenda of psychiatry. Basic science issues such as neuroimaging, neurochemistry, and genetics carry the day instead. There is nothing wrong with basic science research, but before studying the role of brain circuits or cerebral chemistry, shouldn't we be able to specify how the various diseases present clinically? Catatonia is a human behavioral syndrome that for almost a century was buried in the poorly designated psychiatric concept of schizophrenia. Its symptoms are well-known, and some of them are serious. Catatonic patients may die as their temperatures accelerate; they become dehydrated because they refuse to drink; they risk inanition because they refuse to eat or move. Autistic children with catatonia may hit themselves repeatedly in the head. We don't really know what catatonia is, in the sense that we know what pneumonia is. But we can identify it, and it is eminently treatable. Clinicians can make these patients better on a reliable basis. There are few other disease entities in psychiatry of which this is true. So why has there been so little psychiatric interest in catatonia? Why is it simply not on the radar of most clinicians? Catatonia actually occurs in a number of other medical illnesses as well, but it is certainly not on the radar of most internists or emergency physicians. In *The Madness of Fear*, Drs. Shorter and Fink seek to understand why this "vast field of ignorance" exists. In the history of catatonia, they see a remarkable story about how medicine flounders, and then seems to find its way. And it may help doctors, and the public, to recognize catatonia as one of the core illnesses in psychiatry.

It was the first History of Psychology text to include basic pedagogy--elements such as summaries and study questions that several current alternatives still lack. It engages students with interesting biographical tidbits--the fun facts that readers fondly remember after other details fade. Grounded in original source material and contemporary scholarship, the book provides breadth and depth of analysis unrivaled by works of similar length. Brain, Consciousness, and God Sep 27 2019 A constructive critique of neuropsychological research on human consciousness and religious experience that applies the thought of Bernard Lonergan. Brain, Consciousness, and God is a constructive critique of neuroscientific research on human consciousness and religious experience. An adequate epistemology—a theory of knowledge—is needed to address this topic, but today there exists no consensus on what human knowing means, especially regarding nonmaterial realities. Daniel A. Helminiak turns to twentieth-century theologian and philosopher Bernard Lonergan's breakthrough analysis of human consciousness and its implications for epistemology and philosophy of science. Lucidly summarizing Lonergan's key ideas, Helminiak applies them to questions about science, psychology, and religion. Along with Lonergan, eminent theorists in consciousness studies and neuroscience get deserved, detailed attention. Helminiak demonstrates the reality of the immaterial mind and, addressing the Cartesian "mind-body problem," explains how body and mind could make up one being, a person. Human consciousness is presented not only as awareness of objects, but also as self-presence, the self-conscious experience of human subjectivity, a spiritual reality. Lonergan's analyses allow us to say exactly what "spiritual" means, and it need have nothing to do with God. Daniel A. Helminiak is Professor of Psychology at the University of West Georgia. He is the author of many books, including *Religion and the Human Sciences: An Approach via Spirituality and The Human Core of Spirituality: Mind as Psyche and Spirit*, both also published by SUNY Press.

As it traces Western attitudes, it reveals a conversation across centuries and continents as the authors interpret, respond, and build on each other's work. *The Making of Modern Psychiatry* Dec 11 2020 The field of psychiatry changed dramatically in the latter half of the nineteenth century, largely by embracing science. The transformation was most evident in Germany, where many psychiatrists began to work concurrently in the clinic and the laboratory. Some researchers sought to discover brain correlates of mental illness, while others looked to experimental psychology for insights into mental dynamics. Featured here, are the lives and works of Emil Kraepelin - often considered the founder of modern scientific psychiatry, his teacher Bernhard Gudden, and his anatomist colleague Franz Nissl. The book describes scientific findings together with the methods used; it explains why diagnoses were then (and are still now) so difficult to make; it also explores mind-brain controversies. *The Making of Modern Psychiatry* will inform and delight mental health professionals as well as all persons curious about the origins of modern psychiatry. "Ronald Chase has provided fascinating information about the 19th century scientists' thinking on behavioral disorders: how to identify them, how to treat them, how to understand them ... He is a terrific writer and has compiled very interesting stories that bring to life the thinking of the time and the condition of serious mental illnesses in their first stages of understanding ... The author weaves the work

of the 20th to 21st centuries nicely into his story ... gives optimism for a brain-based understanding in the future." Carol Tamminga, M.D. Professor and Chair, Department of Psychiatry, University of Texas Southwestern Medical Center

Part II deals with techniques often used for the study of normal tissue. These include the Golgi method, fluorescence histochemistry, techniques for staining single neurons, and the use of the electron microscope. Part III presents techniques for studying intrinsic connections of the nervous system. These include techniques for silver impregnation of degenerating fibers; autoradiographic technique for studying axonal projections; and somatopetal movement of horseradish peroxidase as a tool for studying connections and neuron morphology.
