The book describes the biology of mental illness and psychopharmacological interventions, provides a DSM-IV diagnosis and a psychiatric nursing diagnosis to a patient condition within the context of the nursing care plan, and clearly demonstrates how nurses integrate neurobiological, behavioural, and social science theories and research into patient care.

**The Dementias** Jul 30 2022 Dementia, technically defined as cognitive impairments sufficiently pervasive and severe enough that they disrupt independent life, is one of the most devastating symptoms of neurologic disease. While Alzheimer's disease (AD) is the most common neurodegenerative disease that causes it, more than 50 medical,

psychiatric, and neurological conditions are associated with dementia. Well organized and expertly planned, this text provides new concepts of patient management that have come about through recent neuroscience research. This volume, reviewing the dementias with the needs of the clinician in mind, is unique in that the section dealing with disease mechanisms reviews the exciting recent scientific advance in regard to Alzheimer disease, whereas the clinical section(section A) focuses not on Alzheimer disease but upon related disorders, the less common dementing syndromes due to other neurodegenerative disorders. The editors of this Blue Book have brought together an extraordinary group of experts to define the scientific advances primarily in Alzheimer's disease (section B) and new treatments (section C) being developed. \* Written for non-expert general neurologists and residents \* Provides new concepts of patient management discovered in neuroscience research \* Includes unique coverage of recent scientific advances in Alzheimer's Disease

Preneoplasia of the Breast Nov 21 2021 Safe and accurate preoperative diagnosis of breast lesions is crucial to spare patients unnecessary, disfiguring operations. The book covers the clinical, radiological and histological diagnosis of benign proliferative breast disease and precursor lesions of breast cancer. It focuses on a new immunohistochemical method based on an innovative progenitor cell concept of breast epithelium that has been developed by Prof. Boecker, Prof. Schnitt and Prof. Silverstein. This technique can also be used for small samples (percutaneous core biopsy) and offers high specificity, and therefore provides a greater degree of diagnostic security. The practical applicability and interpretation of the technique are integrated into a comprehensive description of all benign and malignant noninvasive proliferative diseases of the breast, including: Interpretation of histologic samples attained by stereotactic biopsy (including immunohistochemistry) Comparison of radiologic and pathologic findings Action to be taken in the case of in-situ malignoma Treatment of DCIS. FEATURES describes a new immunohistochemical method - written by the method's pioneers with contributions from renowned European and American pathologists, radiologists and clinicians.

**Contrast-Enhanced MRI of the Breast** Jul 06 2020 Since the first edition of Contrast-Enhanced MRI of the Breast was published in 1990, further progress has been made in the field and interest in magnetic resonance imaging (MRI) as an additional tool in the diagnosis of breast disease has increased. However, further questions have arisen concerning the best choice of technique, the most appropriate way to interpret MR images, and the role which MRI might play in the work-up of breast disease. In this edition

we give an overview of the latest technical possibilities and present knowledge, which today is based on a much greater range of experience gained by various excellent research groups. It is our aim to help the interested reader in choosing an appropriate technique and in finding those applications which promise the greatest benefit for the patient. The particular advantages and limitations of MRI have been pointed out and the currently known capabilities and still existing limitations of other imaging modalities, including transcutaneous biopsy, discussed. Finally, a chapter concerning the use of MRI in the diagnosis of implant failure, a new situation, has been added. Acknowledgements. Since the first edition was published, much further work and research has been necessary. This would not have been possible without the continuous support of many colleagues, coworkers, and advisors.
